- **Oral surface:** The underside of the sea star, featuring the mouth and tube feet.
- **Arms (rays):** Typically five, but sometimes more, arms extend from the central disc, facilitating movement and feeding.

Internal Anatomy

Dissection reveals the internal systems vital for the sea star's physiology.

- **Water vascular system:** A network of fluid-filled canals that operate the tube feet and aid in locomotion and respiration.
- **Madreporite canal:** Connects the madreporite to the ring canal, regulating water intake.

- **Ring canal:** Encircles the central disc, distributing water to the radial canals.

Before beginning the analysis, ensure proper lab preparation:

- Wear gloves to handle sea stars safely and prevent contamination.
- Use dissecting tools carefully to avoid damaging delicate structures.
- Work on a clean workspace, and have dissection trays, pins, and magnifying glasses ready.
- Handle specimens gently to preserve anatomical features.

Safety is paramount, especially since some specimens may be preserved in chemicals like formalin or alcohol. Always follow lab safety protocols.

External Anatomy Observation

The initial step involves a thorough external examination, which provides clues about internal structures and functions.

Key External Features to Identify

- Central Disc: The roughly circular or pentagon-shaped central body from which arms radiate.
- Arms (Rays): Usually five, but some species have more; these are elongated appendages extending from the central disc.
 - Ambulacral Grooves: Grooves running along the underside of each arm, housing tube feet.
 - Madreporite: A small, sieve-like plate usually located on the aboral (top) surface, serving as an entry point for water into the water vascular system.
 - Spines and Pedicellariae: Small, movable structures on the surface that can serve protective functions.

- Coloration and Texture: Variations can indicate species differences or health status.

Observation Tips:

- Use a magnifying glass to examine surface details.
- Note the symmetry and arrangement of arms.
- Record any differences or abnormalities.

Internal Anatomy Dissection

Dissection reveals the internal organs and systems, offering insights into the functional biology of the sea star.

Step-by-Step Dissection Procedure

- Positioning the Sea Star:

- Place the specimen ventral side up (oral surface).
- Secure with pins on a dissecting tray if necessary.

- Opening the Body Cavity:

- Use scissors or a scalpel to make a careful, shallow incision along the central disc or through one arm.

- Extend the cut to expose internal structures, taking care not to damage delicate tissues.

- Identifying Internal Structures:

- Digestive System: Comprising the cardiac stomach, pyloric stomach, pyloric ceca, and digestive glands.

- Water Vascular System: Including madreporite, stone canal, ring canal, radial canals, and tube feet.

- Reproductive Organs: Gonads located within the arms or central disc.

- Nervous System: Nerve rings and radial nerve cords.

Question What are the main external features of a sea star that should be identified during the lab? Key external features include the arms, central disc, tube feet, ambulacral grooves, and spines. Recognizing these helps in understanding sea star anatomy and function. How do you identify the different internal structures of a sea star during dissection? Internal structures such as the stomach, digestive glands, gonads, and pyloric caeca can be identified by carefully examining the body cavity after dissecting along the central disc and arms, using proper tools and techniques. What is the function of the sea star's tube feet, and how are they important to its survival? Tube feet are used for movement, feeding, and respiration. They operate through hydraulic pressure, allowing the sea star to cling to surfaces and manipulate food. Why is the sea star's water vascular system vital, and how can it be observed during the lab? The water vascular system is essential for

movement, respiration, and feeding. It can be observed by examining the madreporite and the radial canals and noting the presence of tube feet connected to this system. How does the sea star's digestive system function, and what structures are involved? The sea star can evert its stomach to externally digest prey. The main structures involved are the cardiac stomach, pyloric stomach, and digestive glands, which aid in digestion and nutrient absorption. What are the key differences between the ambulacral and aboral surfaces of a sea star? The ambulacral surface faces outward and contains the tube feet and ambulacral grooves, while the aboral surface is the opposite side, often featuring the madreporite and lacking tube feet. How can you distinguish between the sea star's reproductive organs during the lab? Reproductive organs, or gonads, appear as small, often orange or yellowish, glandular structures located in the arms or central disc, and can be identified by careful dissection and observation. What safety precautions should be taken when dissecting a sea star in the lab? Use proper dissection tools, handle specimens gently to avoid damage, wash hands afterward, and follow instructor guidelines to prevent contamination or injury. How does analyzing sea star anatomy help us understand echinoderm biology and evolution?
